Published Date: 31 December 2025

Abstract

This study aims to bridge the gap between technology and pedagogy in language education by synthesizing seven influential frameworks that underpin Technology-Enhanced Language Learning (TELL). While the rapid integration of digital technologies has expanded the scope of language learning, the theoretical foundations guiding their use often remain fragmented or underutilized. To address this, the study reviews and compares the following frameworks: Technological Pedagogical Content Knowledge (TPACK), Substitution–Augmentation–Modification–Redefinition (SAMR) model, Activity Theory, Input–Interaction–Output Model from Second Language Acquisition (SLA), Self-Regulated Learning (SRL), Multimedia Learning Theory, and Connectivism. Each framework is examined in terms of its main focus, key concepts, and relevance to digital language learning. The analysis generates a comparative synthesis that highlights cognitive, pedagogical, and sociocultural orientations across models. By offering a structured conceptual map, the study provides researchers, educators, and curriculum designers with clearer pathways for theory-driven implementation of technology in language education. This synthesis not only advances theoretical understanding but also supports purposeful, pedagogically sound applications of digital tools in contemporary language classrooms.

Keywords: Technology-Enhanced Language Learning (TELL), Theoretical Frameworks, Digital Pedagogy, Language Education, Instructional Design

Introduction

The intersection of technology and pedagogy in language education has gained even greater relevance in the post-2020 educational landscape, particularly due to the rapid global shift toward online and hybrid learning models. Digital tools, applications, and online platforms have become integral to language learning processes across formal and informal settings (Bond et al., 2021; Sockett, 2023). Within the broader social sciences, this rapid digitalisation of education has reignited longstanding debates concerning the pedagogical value, equity implications, and epistemological assumptions underlying technology-mediated learning. Recent empirical studies have shown that while digital technologies can enhance learner engagement, interaction, and access to authentic language input, their pedagogical impact

varies significantly depending on how they are theoretically framed and instructionalised (Jawaid et al., 2024; Zahoor & Nawaz, 2025). However, the increased use of technology also brings to the forefront the need for coherent theoretical frameworks to guide its pedagogical integration. Without such grounding, technology may be used superficially or ineffectively, lacking alignment with meaningful instructional goals (Tabassum & Qadir, 2024; Zha et al., 2025).

Technology-Enhanced Language Learning (TELL) has emerged as a robust area of research, offering innovative solutions for enhancing language acquisition, learner engagement, and instructional delivery. Despite this growth, a persistent research problem lies in the fragmented and sometimes uncritical adoption of theoretical frameworks to justify technological interventions. Yet, studies in this domain often rely on a fragmented range of theoretical models, leading to inconsistency in how digital tools are evaluated or implemented (Su & Zou, 2022). This fragmentation reflects a wider concern in the social sciences regarding the tendency toward technocentrism, where technologies are foregrounded while pedagogical, cognitive, and sociocultural dimensions remain under-theorised. Existing frameworks span cognitive, sociocultural, and pedagogical paradigms, each offering valuable insights into the roles of interaction, autonomy, and context in language learning (Bang, 2024; Su & Zou, 2022). Yet, these frameworks are often applied in isolation, limiting their explanatory power and reducing opportunities for integrative theorising.

A systematic synthesis of these frameworks is therefore a critical theoretical need rather than a methodological preference. By consolidating and comparing them, researchers and educators can address the theory–practice gap that continues to challenge technology-enhanced education across disciplines. From a social science perspective, such synthesis contributes to ongoing debates about how learning is mediated by tools, how agency is distributed between learners and technologies, and how pedagogical decisions are shaped by broader institutional and cultural contexts. This approach not only deepens theoretical clarity but also supports the development of context-sensitive, pedagogically sound, and evidence-based practices in digital language learning.

Responding to these theoretical and disciplinary gaps, this concept paper synthesizes seven influential frameworks frequently applied in TELL research: Technological Pedagogical Content Knowledge (TPACK), the SAMR model, Activity Theory, the Input–Interaction–Output Model from SLA, Self-Regulated Learning (SRL), Multimedia Learning Theory, and Connectivism (see Figure 1). By comparing their key constructs, applications, and theoretical orientations, this paper provides a conceptual synthesis that helps researchers and practitioners make informed decisions about integrating technology into language education. Specifically, the study is guided by two research questions:

1. *What are the core theoretical orientations, key concepts, and pedagogical applications of the seven prominent frameworks commonly used in TELL research?*
2. *How can a conceptual synthesis of these frameworks provide a coherent foundation for bridging technology and pedagogy in TELL, thereby informing both research design and instructional practice?*

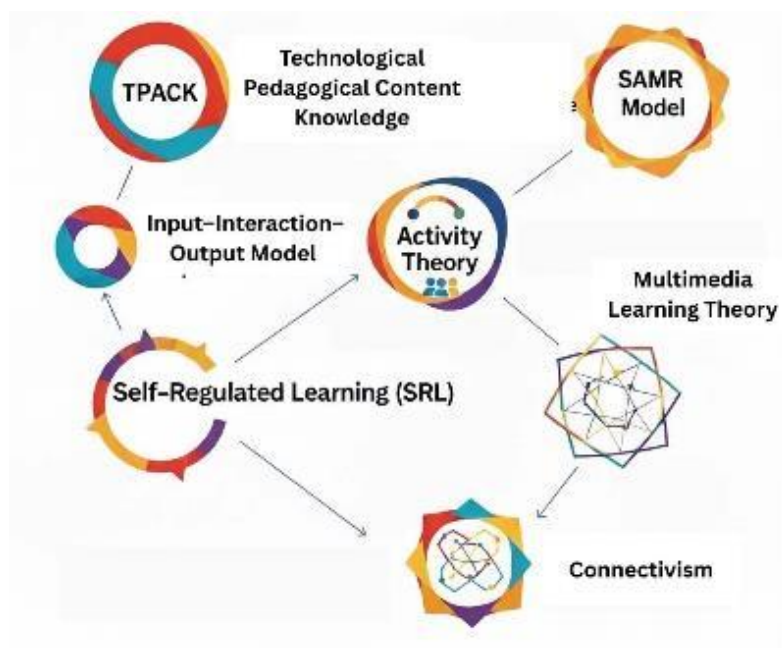

Figure 1 Conceptual Framework of TELL

Methodology

This concept paper adopts a qualitative conceptual research approach aimed at synthesizing and critically examining theoretical frameworks relevant to TELL. Rather than engaging in empirical investigation, the methodology is grounded in theoretical consolidation, with the goal of offering structured insights that inform both academic research and practical pedagogical applications. This approach is suitable for mapping conceptual relationships among well-established frameworks and highlighting their pedagogical and epistemological implications for language education in digitally mediated environments (Snyder, 2019).

To address the two research questions, the study employed a conceptual analysis design (Jabareen, 2009), which involves reviewing, categorizing, and interpreting conceptual frameworks frequently cited in TELL-related literature. This design allows the development of both (a) a framework-specific mapping that clarifies orientations, concepts, and applications (RQ1), and (b) a thematic synthesis (Thomas & Hayden) that integrates these frameworks into a coherent conceptual model bridging technology and pedagogy (RQ2).

Seven frameworks were selected using four criteria: (1) frequent citation in recent TELL research; (2) relevance to digital language pedagogy in online, hybrid, or technology-enhanced contexts; (3) representation of diverse theoretical traditions, including cognitive, sociocultural, and pedagogical perspectives; and (4) evidence of practical applicability to language education, demonstrated through empirical or design-based studies.

The data for this conceptual analysis were obtained from a comprehensive review of peer-reviewed journal articles indexed in Scopus, Web of Science, and ERIC databases. Foundational texts and book chapters by the originators of the selected frameworks were also consulted to provide both historical grounding and contemporary interpretations. Priority was given to works published after 2020 to ensure alignment with recent developments in digital pedagogy and post-pandemic educational practices.

To facilitate systematic comparison, a comparative matrix was developed to analyze the frameworks across four key dimensions: (1) pedagogical focus (e.g., teacher knowledge, learner interaction, content transformation), (2) core theoretical constructs (e.g., dual coding, self-regulation, mediation), (3) practical applications in TELL (e.g., task design, tool integration, instructional planning), and (4) key contributors shaping the frameworks' development. This matrix enabled both fine-grained description (RQ1) and cross-framework thematic synthesis (RQ2). The thematic analysis was further visualized through a Venn diagram model, which highlights the intersections among cognitive, sociocultural, and instructional design orientations, thereby illustrating how the frameworks collectively provide a foundation for bridging technology and pedagogy in TELL.

Results and Discussion

The review of key frameworks provides a foundation for understanding how theoretical models guide the design, implementation, and evaluation of TELL. As summarized in Table 1, seven prominent frameworks, namely TPACK, SAMR, Activity Theory, the Input–Interaction–Output (IIO) Model, Self-Regulated Learning (SRL), Multimedia Learning Theory (MLT), and Connectivism, are highlighted along with their main focus, key concepts, example applications, and recent studies. This overview establishes a structured basis for the detailed discussion of each framework that follows.

Table 1

Key Research Frameworks for TELL

Framework	Main Focus	Key Concepts	Example Application	Example Studies
TPACK (Technological Pedagogical Content Knowledge – Mishra & Koehler, 2006)	Teacher integration of technology into language teaching	Tech + pedagogy + content knowledge	Evaluating how teachers use apps and platforms in ELT	Alhamid & Mohammad- Salehi, (2024) Darsih et al. (2023) Zhang & Fang (2022)
SAMR (Substitution– Augmentation– Modification– Redefinition – Puentedura, 2006)	How deeply technology transforms language learning tasks	Levels of tech integration	Analyzing task redesign using online collaborative tools	Al-Khalidi & Nizwa (2021) Buledi & Badariah (2024) Nguyen (2024)
Activity Theory (Engeström, 1987)	Complex interactions between students, tools, and learning goals	Subject, tools, rules, community, outcomes	Studying LMS or app-based language learning environments	Pullenayegem et al. (2021) Rong & Yao (2025) Wang et al. (2024)
Input–Interaction– Output Model (Long, 1980, 1996)	Technology- supported communicative interaction	Input → interaction → output	Chatbot use for practicing conversational English	Liu (2022) Mostafa & Kim (2021) Nie (2023)

Self-Regulated Learning – SRL (Zimmerman, 2002)	Learner autonomy and independent language learning	Planning, monitoring, self-evaluation	Using apps like Duolingo or Quizlet to support self-study	Apridayani et al. (2023) Han et al. (2021) Yabukoshi & Mizumoto (2024)
Multimedia Learning Theory – MLT (Mayer, 2001; Paivio, 1971)	Using multimedia to enhance language comprehension and retention	Dual coding, multimedia principle	Using videos with subtitles or AR/VR for vocabulary learning	Immanuel & Hameed (2023) Mayer (2022) Sayyadi et al. (2024)
Connectivism (Siemens, 2005; Downes, 2007)	Learning through digital networks and communities	Learning as networking and information flow	Language learning through MOOCs, YouTube, and social media	Al Maawali (2022) Astrini et al. (2024) Malave Tomala & Rosales Bone (2024)

Technological Pedagogical Content Knowledge

The Technological Pedagogical Content Knowledge (TPACK) framework, as depicted in Figure 2, conceptualized by Mishra and Koehler (2006), provides a comprehensive model for understanding how teachers integrate technology effectively into their subject-specific pedagogy. It emphasizes the interplay among three essential domains of teacher knowledge: technological knowledge (TK), pedagogical knowledge (PK), and content knowledge (CK). In the context of TELL, TPACK offers a theoretical lens through which to examine the alignment between digital tools, teaching strategies, and language-specific learning goals.

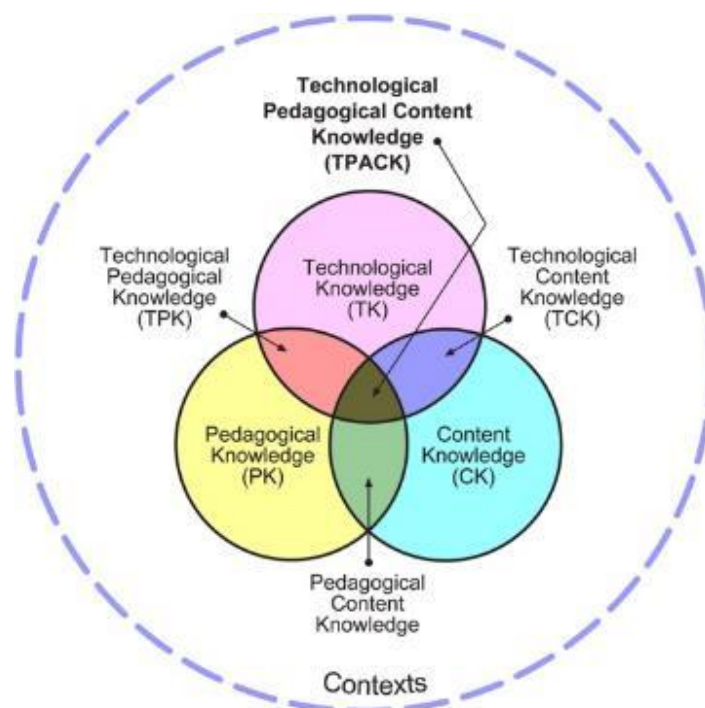

Figure 2 TPACK Framework

A key strength of the TPACK framework lies in its assertion that effective technology use in education requires more than technical proficiency. Teachers must understand how technology intersects with pedagogy and content to create meaningful learning experiences (Mishra & Koehler, 2006). This triadic interaction is particularly vital in language education, where digital tools must be selected and implemented based on learners' language proficiency levels, communicative needs, and instructional objectives. As such, TPACK serves not only as a diagnostic tool for teacher development but also as a guide for instructional planning in digital learning environments (Elmaadaway & Abouelenein, 2023).

In practical TELL applications, TPACK supports language teachers in designing activities that integrate interactive platforms, multimedia content, and real-time feedback tools. For instance, grammar instruction can be enhanced through gamified platforms like Quizizz, while pronunciation can be practiced via speech recognition software embedded in mobile apps. These decisions are guided by the teacher's ability to evaluate which technological affordances best match pedagogical approaches and language content (Chai et al., 2013). Such decisions also depend on the contextual factors influencing teachers' classroom environments, including curriculum demands and student digital literacy levels (Koehler et al., 2014).

Over the past decade, TPACK has evolved into a foundational model in digital pedagogy and teacher education research. Its relevance to TELL continues to grow, particularly in response to the global shift toward hybrid and remote learning environments. By promoting reflective practice, TPACK empowers educators to make pedagogically sound and context-sensitive choices in technology integration. As a result, the framework remains a valuable tool for understanding and improving how language teachers design, deliver, and assess digitally mediated learning experiences.

Substitution–Augmentation–Modification–Redefinition (SAMR) Model

The SAMR model, as illustrated in Figure 3 and developed by Ruben Puentedura (2010), provides an accessible framework for evaluating how deeply digital technology alters instructional practices. It is structured into four hierarchical levels: Substitution, Augmentation, Modification, and Redefinition. These levels represent a continuum of technology integration, moving from enhancement to transformation of learning tasks. The model has gained popularity in educational contexts for its simplicity and adaptability across disciplines, including TELL, where it is used to assess the pedagogical depth of digital language activities (Hamilton et al., 2016).

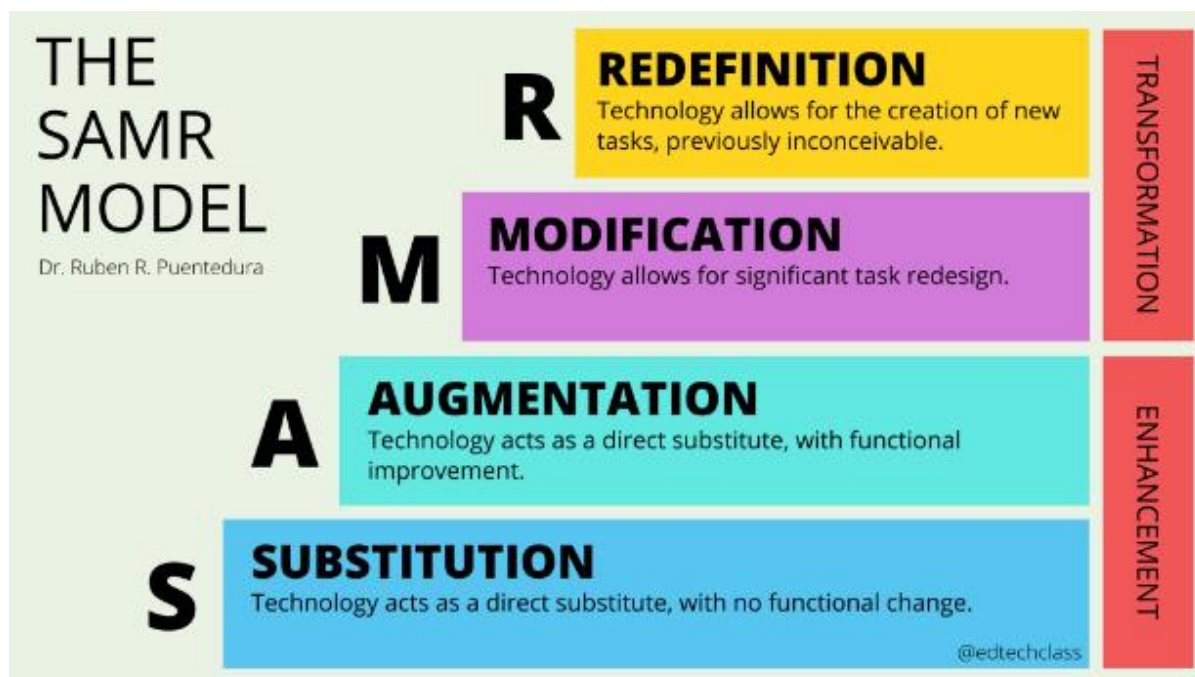

Figure 3 The SAMR Model

At the enhancement level, Substitution refers to the direct replacement of traditional tools with digital alternatives without functional change—such as typing an essay using a word processor instead of handwriting it. Augmentation introduces functional improvements, like the inclusion of spell-check, grammar suggestions, or integrated dictionaries. These stages, while minimal in innovation, offer foundational steps toward digital literacy and comfort in language production tasks (Zamri & Mohamad, 2024). They also provide opportunities for educators to build learner familiarity with basic digital tools before transitioning to more complex, interactive environments.

The Modification stage marks a pedagogical shift, where technology enables the redesign of tasks and promotes new forms of learner collaboration. An example in TELL includes the use of collaborative writing platforms such as Google Docs, which support synchronous peer feedback, co-editing, and real-time scaffolding. The Redefinition level represents the highest degree of transformation, where technology allows for entirely novel learning experiences such as cross-cultural virtual exchanges, interactive storytelling using multimedia tools, or immersive language practice through virtual reality. These transformations expand learners' linguistic, intercultural, and digital competencies (Dhivya et al., 2024).

While the SAMR model does not explicitly address pedagogical content or instructional context like the TPACK framework, its strength lies in offering educators a reflective tool for assessing the impact of technology on student engagement and task complexity. In TELL, it serves as a scaffold for lesson planning and innovation, enabling instructors to transition from surface-level digital usage to deeper, transformative practices. Nonetheless, critics have argued that the model lacks theoretical grounding and should be complemented by pedagogical models to guide intentional design (Hamilton et al., 2016). Despite these limitations, SAMR continues to be a widely recognized and useful reference in technology integration discourse.

Activity Theory

Activity Theory, as shown in Figure 4, offers a socio-cultural perspective on learning that foregrounds the complex, dynamic interplay between individuals and their environments. Originating from the work of Vygotsky (1978) and later expanded by Engeström (1987), the theory emphasizes that human learning and development are mediated by tools, social context, and culturally embedded practices. Rather than isolating the learner as an independent cognitive processor, Activity Theory situates learning within broader activity systems, making it highly relevant for analyzing interactions in TELL environments (Kaptelinin & Nardi, 2009).

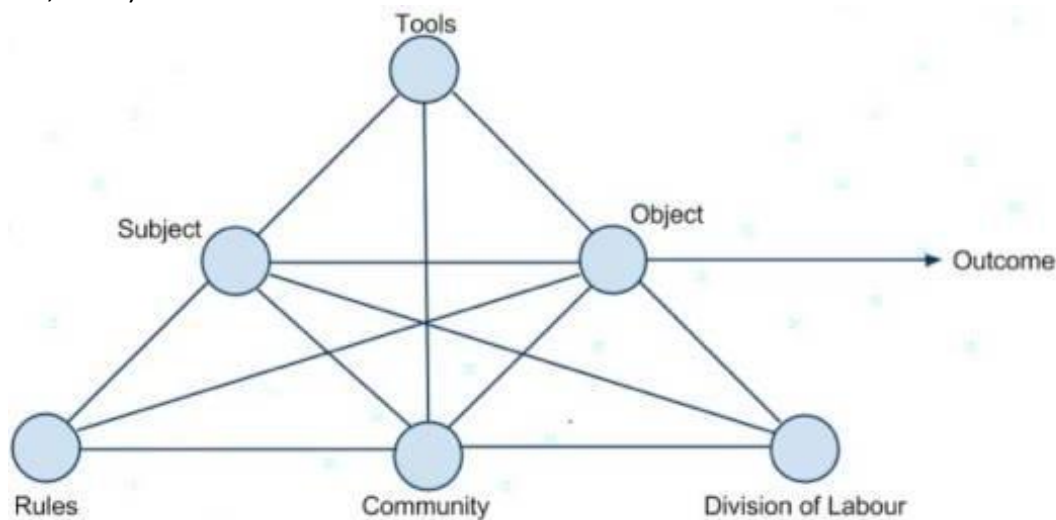

Figure 4 Activity Theory

Engeström's (1987) expanded model of an activity system includes key components: the subject (learner), object (goal or motive), tools (technological or symbolic mediators), rules (norms and conventions), community (social groups), division of labor (roles and responsibilities), and outcome (results or transformations). This configuration enables researchers and educators to analyze how different elements interact within learning ecosystems. In the context of TELL, contradictions within or between these components—such as digital access gaps, conflicting institutional expectations, or tool misalignment—can inform deeper understanding of learning breakdowns and opportunities for system redesign (Engeström & Sannino, 2017).

In language education, Activity Theory has been applied to study how digital tools such as learning management systems (LMS), mobile applications, and online collaborative platforms mediate students' language learning experiences. For instance, a blended ESL course using Moodle not only serves as a tool for delivering content but also acts as a site for social negotiation, assessment, and feedback. These interactions are shaped by institutional policies, teacher presence, and learner autonomy (Barab et al., 2013). As learners navigate the digital landscape, their activities are constantly shaped by, and reshaping the system in which they operate.

One of the key advantages of Activity Theory is its suitability for longitudinal and design-based research, as it captures the evolution of learning practices over time. Its emphasis on contradiction as a driver of transformation makes it a valuable framework for

evaluating the affordances and limitations of digital tools in authentic learning settings. In TELL contexts, where technologies are continually evolving, Activity Theory supports a systemic and process-oriented understanding of how learners, tools, and environments co-develop (Yamagata-Lynch, 2010). This makes it particularly relevant for studies aiming to design, implement, and refine pedagogical innovations.

Input–Interaction–Output Model (Second Language Acquisition)

The Input–Interaction–Output (IIO) model, primarily developed by Michael Long (1980, 1996), provides a foundational framework in Second Language Acquisition (SLA) research and has been increasingly applied to TELL contexts. This model conceptualizes language learning as a dynamic, cyclical process in which exposure to comprehensible input, engagement in meaningful interaction, and the production of output are interdependent conditions necessary for acquisition (Gass & Mackey, 2014). It offers a theoretical basis for communicative language learning environments, particularly those supported by digital technologies.

Long (1996) emphasized that while comprehensible input is necessary, it is not sufficient for acquisition. Learners must engage in interactions that involve negotiation of meaning such as requesting clarification, confirming understanding, or reformulating utterances. These interactions modify input and prompt cognitive restructuring, enabling deeper language processing. Swain (2005) further argued that producing language (output) allows learners to test hypotheses, notice linguistic gaps, and enhance fluency and accuracy. Together, input, interaction, and output function as mutually reinforcing processes essential for meaningful language development.

Within TELL, the IIO model underpins the design of interactive tools that simulate or facilitate authentic communication. Chatbots, AI-driven speaking apps, peer feedback systems, and synchronous video conferencing are examples of technologies that create opportunities for learners to engage in structured conversational practice. Online platforms such as HelloTalk and Tandem offer real-time language exchanges with native speakers, allowing for naturalistic interaction and negotiation of meaning. These tools exemplify how digital environments can operationalize the principles of the IIO model by supporting reciprocal input-output loops (Chapelle, 2006; Mutiga, 2025).

Moreover, digital platforms often include scaffolding features such as sentence frames, visual cues, translation aids, and corrective feedback, which reduce cognitive load and foster more effective interaction. In this sense, the IIO model aligns with broader pedagogical goals of communicative competence, especially in speaking and writing. Its emphasis on interactivity and meaningful language use continues to inform research and instructional design in digitally mediated SLA contexts. As technological tools become more responsive and personalized, the model remains a relevant and adaptable framework for promoting interaction-rich, learner-centered environments.

Self-Regulated Learning (SRL)

Self-Regulated Learning (SRL) is a prominent metacognitive framework that underscores the learner's proactive role in controlling their own learning process. Grounded in Bandura's social cognitive theory, SRL was elaborated by Zimmerman (2002) as a cyclical model

comprising three key phases: forethought, performance, and self-reflection. During the forethought phase, learners engage in goal setting and strategic planning. In the performance phase, they apply strategies and monitor progress, while the self-reflection phase involves evaluating outcomes and adjusting approaches. In the context of TELL, SRL serves as a theoretical foundation for designing environments that foster autonomy, motivation, and strategic engagement.

The integration of digital technologies significantly amplifies opportunities for self-regulated behavior. SRL theory suggests that successful learners self-direct their learning by deploying cognitive strategies, sustaining motivation, and managing their behaviors. Tools such as learning analytics dashboards, adaptive feedback systems, and interactive planning interfaces offer learners the ability to set personalized goals, track their progress, and receive real-time performance feedback (Panadero, 2017). In language education, such affordances support tasks like vocabulary retention, reading fluency, and pronunciation practice by enabling learners to take ownership of their learning trajectories.

In practical terms, SRL principles are embodied in widely used TELL platforms such as Duolingo, Quizlet, and Memrise. These applications allow learners to engage in flexible, self-paced study while simultaneously monitoring their progress via visual data representations such as streaks, scores, and level indicators. Research has shown that when these technologies are combined with explicit SRL strategy instruction such as goal setting, reflection prompts, and time management scaffolds, learner motivation, engagement, and achievement improve significantly (Dörnyei, 2006; Pérez-Sanagustín et al., 2021). Moreover, SRL contributes to more personalized learning experiences, allowing users to select tools and content aligned with their preferences and proficiency levels.

Importantly, SRL is well-suited to the flexible and often asynchronous nature of online and blended language learning. In such environments, learners face varying degrees of autonomy and must navigate challenges such as self-discipline, delayed feedback, and content overload. Embedding SRL strategies into digital learning design through guided reflection tools, progress visualization, or peer comparison features can empower learners not only to become more effective language users but also to develop lifelong learning competencies. Thus, SRL stands as a critical framework for both researchers and educators striving to optimize learner-centered design in the digital age.

Multimedia Learning Theory

Multimedia Learning Theory (MLT), developed by Richard E. Mayer (2001), is a cognitive framework that explains how individuals learn more effectively from words and visuals than from words alone. Central to the theory is the dual-channel assumption, which posits that learners process information through two distinct cognitive channels, namely visual/pictorial and auditory/verbal, with limited capacity in each (Mayer, 2009). MLT asserts that optimal learning occurs when instructional content is designed to reduce cognitive overload and foster active mental integration of words and images. In TELL, MLT offers evidence-based design principles to create digital materials that support deeper comprehension and long-term retention.

Mayer's Cognitive Theory of Multimedia Learning (CTML) articulates several design principles, including coherence (removing extraneous information), redundancy (avoiding unnecessary duplication of audio and text), modality (favoring spoken text over printed when paired with visuals), and signaling (highlighting key information). These principles are especially relevant in language education, where the integration of graphics, animations, subtitles, and audio can scaffold understanding of vocabulary, grammar, and pronunciation. For instance, pairing spoken language with illustrative visuals or using color-coded text to emphasize grammatical structures helps reduce extraneous load and enhance learner focus (Mayer, 2009; Moreno & Mayer, 2007).

In practical TELL applications, MLT principles underpin the design of a wide array of instructional tools such as language learning videos, interactive digital books, and augmented or virtual reality (AR/VR) environments. Features like dynamic subtitles, interactive feedback, and synchronized text-audio narration exemplify how MLT supports language learning through multimodal input. These approaches cater to diverse learning preferences and facilitate dual coding, a cognitive mechanism that allows learners to store information both verbally and visually (Paivio, 1990). MLT is particularly beneficial for tasks involving vocabulary acquisition, listening comprehension, and pronunciation, where visual-verbal coordination reinforces memory and retrieval.

Moreover, the alignment between MLT and second language acquisition (SLA) theories is noteworthy. SLA emphasizes the role of comprehensible input and meaningful context in language learning, both of which are supported through well-designed multimedia content. By leveraging visual scaffolding and multimodal input, educators can create more inclusive, engaging, and cognitively effective learning environments. As digital media continue to evolve, MLT remains a relevant and powerful framework for guiding the design of pedagogically sound language learning experiences.

Connectivism

Connectivism, introduced by Siemens (2005) and expanded upon by Downes (2007), is a contemporary learning theory that reflects the impact of digital technologies on the processes of knowledge acquisition and meaning-making. Unlike traditional cognitive or constructivist theories, Connectivism conceptualizes learning as the ability to form and navigate networks of information, people, and digital resources. It posits that learning is no longer solely an internal process but one that is distributed across technological ecosystems. In the context of TELL, Connectivism offers a framework to understand how learners engage with decentralized sources of knowledge in dynamic, digital environments (Bell, 2011).

Central to Connectivism is the idea that the capacity to know more is more critical than what is currently known. Learning involves accessing nodes of knowledge including digital repositories, communities, algorithms, and making meaningful connections among them. Siemens (2005) identifies several key principles of the theory: learning and knowledge rest in diversity of opinions; learning is a process of connecting specialized nodes; and decision-making is itself a learning process. The emphasis on network fluency and personal learning networks (PLNs) positions learners as navigators of information rather than passive recipients, particularly relevant in fast-changing digital language environments.

In TELL settings, Connectivism underpins practices such as participating in online language forums, engaging in social media communication, and accessing Massive Open Online Courses (MOOCs) or open educational resources. Through these networks, learners co-construct language knowledge, receive peer and AI-mediated feedback, and personalize their learning journeys. Platforms like Tandem, Reddit language communities, and YouTube vlog channels support the connectivist approach by enabling real-world language exposure and decentralized participation (Kop, 2011). These environments reflect a shift from teacher-led instruction to learner-driven, interest-based interaction.

Importantly, Connectivism aligns with educational trends emphasizing learner agency, digital literacy, and lifelong learning. It challenges traditional language learning paradigms by recognizing that competence is not just linguistic but also includes the ability to search, evaluate, and synthesize online content. For educators, Connectivism provides a theoretical foundation for designing networked language learning environments that foster autonomy, collaboration, and digital citizenship. As learners become increasingly embedded in global digital ecosystems, Connectivism offers a timely and adaptable framework for understanding how language education can thrive in the 21st century.

Cross-Framework Comparison and Thematic Insights

The seven frameworks synthesized in this paper offer diverse yet complementary lenses through which to examine the integration of technology in language education. When analyzed thematically, these frameworks reveal critical insights into the theoretical orientations, pedagogical applications, and practical implications of TELL. Several emerging patterns underscore the multifaceted nature of designing and implementing technology-supported language instruction.

To begin with, one of the most salient distinctions among the seven frameworks lies in their theoretical orientations. As illustrated in Figure 5, MLT, SRL, and the IIO Model are primarily grounded in cognitive psychology, emphasizing internal processes such as attention, memory, strategic planning, and hypothesis testing. These models position technology as a tool to support comprehension, skill acquisition, and individual learning strategies. In contrast, Activity Theory and Connectivism reflect sociocultural orientations, framing learning as a mediated and collaborative process shaped by tools, norms, communities, and networks. Bridging these two perspectives, TPACK and SAMR serve as instructional design frameworks, offering adaptable models that guide educators in planning, integrating, and evaluating technology use, while drawing from both cognitive and sociocultural traditions depending on context.

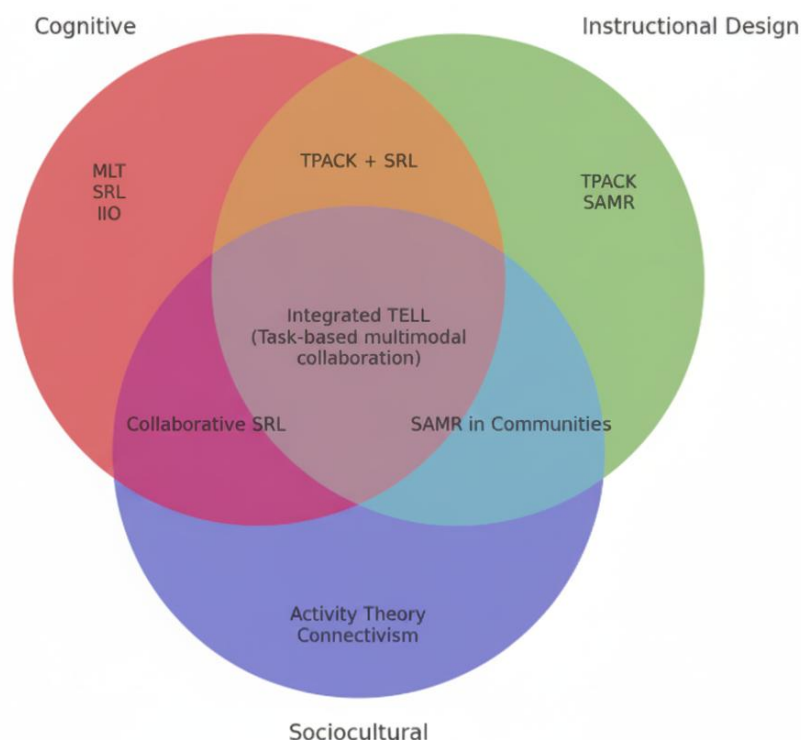

Figure 5 Venn Diagram of Theoretical Orientations in TELL Frameworks

Equally important is the distinction in the locus of agency, whether the frameworks emphasize the teacher's or the learner's role. TPACK and SAMR are typically teacher-centered, providing tools for educators to plan, integrate, and evaluate digital technologies in instructional settings. They support curriculum development and pedagogical decision-making. On the other hand, SRL, the IIO Model, and Connectivism highlight learner agency, focusing on autonomy, goal-setting, self-monitoring, interaction, and networked engagement. This differentiation plays a key role when aligning research goals with theoretical frameworks: inquiries into pedagogical design may benefit from TPACK or SAMR, whereas studies on student motivation, autonomy, or collaborative behavior might align better with SRL or Connectivism.

Another important dimension involves how each framework conceptualizes the depth of technology integration. SAMR outlines a four-tiered model, from Substitution to Redefinition, providing a clear structure to assess how technology transforms teaching and learning tasks. TPACK, though non-hierarchical, emphasizes the intersection of content, pedagogy, and technology as the foundation for effective integration. In contrast, Activity Theory and Connectivism do not offer linear stages but instead explore how technology mediates evolving systems, roles, and relationships over time. These differences point to varying degrees of specificity and adaptability, with some frameworks providing clear implementation guides and others offering open-ended, systemic interpretations.

Furthermore, the adaptability of each framework to various educational contexts further distinguishes their utility. Activity Theory and Connectivism are particularly suited to complex, learner-driven environments such as global exchanges, online communities, or hybrid learning spaces, where learning is fluid, situated, and influenced by sociocultural dynamics. In contrast, MLT and SRL are most effective in structured settings such as

classrooms or guided online courses, where instructional sequences, scaffolding, and self-regulatory supports can be intentionally designed. This contrast highlights the importance of selecting frameworks based on contextual factors such as learner readiness, institutional objectives, technological access, and pedagogical goals.

Taken together, the synthesis of these frameworks offers more than theoretical insight, it provides a practical roadmap for researchers and educators. For instance, a study exploring vocabulary retention through mobile apps could benefit from integrating MLT to address multimodal input and SRL to enhance learner autonomy and strategy use. Conversely, research into transnational language exchanges or collaborative writing platforms might find theoretical grounding in Connectivism and Activity Theory, given their emphasis on social networks, tool mediation, and evolving learning communities. By understanding these frameworks as interconnected rather than isolated, scholars and practitioners can make more informed, context-sensitive decisions that enhance both the theoretical rigor and pedagogical relevance of TELL initiatives.

Conclusion

This concept paper has presented a systematic synthesis of seven influential theoretical frameworks that inform the field of Technology-Enhanced Language Learning (TELL): Technological Pedagogical Content Knowledge (TPACK), Substitution–Augmentation–Modification–Redefinition (SAMR), Activity Theory, the Input–Interaction–Output (IIO) Model, Self-Regulated Learning (SRL), Multimedia Learning Theory (MLT), and Connectivism. Each framework offers a distinct lens for understanding how digital tools mediate, support, and transform the processes of language teaching and learning.

Through comparative thematic analysis, the paper reveals critical distinctions and intersections among these frameworks in terms of cognitive versus sociocultural orientations, teacher- versus learner-centeredness, levels of technology integration, and adaptability to various educational contexts. This multidimensional understanding encourages scholars and educators to move beyond isolated theoretical applications and adopt integrative approaches that better reflect the complexities of digital language learning environments.

The findings underscore the importance of theoretical clarity and alignment in both TELL research and pedagogical practice. A framework-informed approach not only enhances instructional design and learner engagement but also strengthens the validity and interpretability of empirical studies. Moreover, recognizing the affordances and limitations of each framework allows stakeholders to make contextually grounded decisions regarding the implementation and evaluation of technology in language education.

This study makes several important theoretical and contextual contributions to the field of Technology-Enhanced Language Learning and to broader discussions within the social sciences. Theoretically, it advances existing knowledge by offering an integrative synthesis of seven widely used yet often fragmented frameworks, thereby addressing the persistent lack of conceptual coherence in TELL research. By mapping their orientations, assumptions, and pedagogical implications, the study moves beyond framework-specific applications and contributes a holistic perspective that clarifies how cognitive, sociocultural, and technological dimensions of learning intersect. Contextually, the synthesis responds to post-pandemic

educational realities in which digital technologies are no longer supplementary but structurally embedded in language education across diverse settings. The proposed conceptual alignment provides researchers with a principled basis for theory selection and research design, while offering educators a reflective guide for making pedagogically sound and context-sensitive decisions about technology integration. As such, this study contributes not only to theoretical refinement but also to the practical and ethical advancement of technology-mediated language learning in contemporary educational contexts.

In conclusion, this synthesis contributes a valuable roadmap for advancing theory-informed innovation in TELL. By bridging pedagogical intention with technological affordance, it supports the development of meaningful, equitable, and evidence-based language learning practices. As digital learning ecosystems continue to expand and evolve, such theoretically grounded insights will be indispensable for shaping the future of language education.

Implications for Research and Practice

The conceptual synthesis presented in this paper offers significant implications for both empirical inquiry and pedagogical innovation in the field of TELL. By framing the selected frameworks within a comparative structure, this study provides a strategic foundation for aligning theoretical models with research agendas, instructional practices, and institutional planning. These frameworks serve not only as interpretive tools but also as practical guides for the thoughtful integration of technology in language education.

For researchers, the synthesized frameworks offer a clear pathway for aligning research questions with appropriate theoretical underpinnings. Studies exploring learner autonomy, motivation, or digital engagement may find strong alignment with Self-Regulated Learning (SRL) or Connectivism, which foreground learner agency and networked learning. Conversely, empirical studies investigating the cognitive effects of multimedia-based vocabulary instruction may benefit from the application of Multimedia Learning Theory (MLT). This comparative framework encourages scholars to adopt more nuanced, multi-framework approaches, enabling a richer understanding of the complex dynamics in TELL contexts. Furthermore, the integration of theory into research design enhances the analytical depth and explanatory scope of studies. By selecting frameworks that align with the pedagogical or technological focus of inquiry, researchers can better articulate how digital tools mediate linguistic input, scaffold learner interaction, or influence instructional efficacy. The result is a more robust body of research that is both theoretically informed and practically relevant.

From a pedagogical perspective, the synthesized models provide a conceptual toolkit to support the design, implementation, and evaluation of technology-integrated instruction. The TPACK framework can be employed to ensure the alignment of technological tools with both pedagogical intentions and content objectives. The SAMR model offers a practical lens for reflecting on the depth and purpose of technology use, encouraging educators to move beyond basic substitution toward transformative learning designs. Activity Theory and Connectivism offer valuable perspectives for designing collaborative, student-centered learning experiences such as online language exchanges, project-based learning, or peer-feedback platforms. Incorporating SRL strategies into digital platforms such as goal-setting prompts, progress dashboards, or reflection activities can further enhance learner agency and

promote deeper engagement. These models collectively support the shift from passive technology use to intentional, learner-driven innovation in the language classroom.

At the institutional level, curriculum developers and education policymakers can leverage these frameworks to inform the strategic integration of digital tools into language programs. Theoretically informed curricula are more likely to foster meaningful, context-sensitive learning experiences that reflect both pedagogical priorities and technological affordances. TPACK and MLT, for example, can serve as foundational models for teacher professional development and digital literacy initiatives, helping educators make informed decisions about tool selection and instructional design. Moreover, by embedding frameworks such as SRL and Connectivism into curriculum guidelines, institutions can support the development of 21st-century competencies, including digital fluency, self-directed learning, and global communication. Such integrative approaches also contribute to quality assurance in TELL implementation, ensuring that technology adoption is not only innovative but also pedagogically sound.

AI Use Acknowledgment

This manuscript was prepared with limited assistance from artificial intelligence tools. ChatGPT (OpenAI) was used to support language refinement, organisation of ideas, and improvement of sentence clarity during the drafting process. In addition, Gemini (Google) was used solely for analysing reference images to assist in the interpretation and summarisation of visual content relevant to the conceptual discussion. All intellectual contributions, interpretations, arguments, and final decisions remain entirely the responsibility of the authors. No AI tool was used to generate data, conduct analysis, or draw conclusions.
